

Double Glazing and Acoustic Insulation

Acoustic Insulation

Acoustic insulation is a material that is used to reduce the amount of sound that enters a room. It is typically made of a dense, fibrous material that absorbs sound waves. Acoustic insulation is often used in walls, ceilings, and floors. It can be used to reduce noise from outside the room, such as traffic or construction, or to reduce noise from inside the room, such as a television or a radio. Acoustic insulation is also used in recording studios to prevent sound from reflecting off the walls and creating echoes.
