

# Starphire **Emissivity Insulating Glass** - **Low Emissivity Insulating Glass** **IGU** **IGU** **IGU**

Emissivity Insulating Glass (IGU) is a type of glass that is designed to reduce heat loss through a building's windows. It consists of two or more glass panes with a thin layer of low-emissivity (low-E) coating on the inner surface of the inner pane. This coating reflects heat back into the building, helping to keep it warm in winter and cool in summer. IGU is commonly used in commercial and residential buildings to improve energy efficiency and reduce heating and cooling costs.

Emissivity Insulating Glass (IGU) is a type of glass that is designed to reduce heat loss through a building's windows. It consists of two or more glass panes with a thin layer of low-emissivity (low-E) coating on the inner surface of the inner pane. This coating reflects heat back into the building, helping to keep it warm in winter and cool in summer. IGU is commonly used in commercial and residential buildings to improve energy efficiency and reduce heating and cooling costs. IGU can be made with various types of glass, including float glass, tempered glass, and laminated glass. The most common type of IGU is made with float glass and a low-E coating. IGU is available in a variety of sizes and thicknesses to meet the needs of different applications.
