

KKXG lacquered 3D printed parts

lacquered 3D printed parts are available in a wide range of colors and finishes. The lacquer is applied to the surface of the printed part, providing a smooth, glossy finish. This process is used to protect the part from wear and tear, and to enhance its appearance. The lacquer is applied in a thin, even layer, and is cured under heat and light. This process is used to create a variety of finishes, including matte, semi-gloss, and high-gloss. The lacquer is also used to create a variety of colors, including black, white, and a wide range of colors. The lacquer is applied to the surface of the printed part, and is cured under heat and light. This process is used to create a variety of finishes, including matte, semi-gloss, and high-gloss.
