SGP interlayer is a special type of plastic film used in laminated glass. It is made of polyvinyl butyral (PVB) or ethylene vinyl acetate (EVA) resin. The interlayer is sandwiched between two or more glass panes and is heated and pressed together under heat and pressure. This process creates a strong bond between the glass panes, making the laminated glass resistant to impact and shattering. The interlayer also provides additional safety by holding the glass together in the event of a break. The thickness of the interlayer is typically 1.14 mm, 1.52 mm, or 2.0 mm. The interlayer is also available in different colors, such as clear, grey, and blue.
